

BioCoir[®]

Coconut Fiber Biofilter

BioCoir is a modular system for residential and commercial applications. BioCoir is prepackaged in a module housing featuring natural media. BioCoir protects sensitive watersheds through removal of nitrogen and other constituents.

BioCoir

BioCoir utilizes coconut fiber (coir) media housed in an engineered mod. Coir are the fibers that constitute the thick mesocarp, or husk, of the coconut fruit. Coconut fiber is low-cost and a renewable resource. The short-to-medium length fibers are a ligno cellulosic material and by-product of coconut harvesting in many developing nations. The high lignin content of these fibers results in a durable material. Pretreated effluent is sprayed over the media using specially designed helical spray nozzles that provide uniform distribution over the entire surface area within the mod. Treated effluent is recirculated through the media multiple times, which optimizes treatment.

Applications

- Residential
- Commercial or community
- Intermittent or seasonal use
- Space constrained sites
- All climate conditions
- Nitrogen sensitive areas

Why Choose BioCoir?

- Produces high quality effluent
- Certified to NSF/ANSI Standards 40 and 3rd party nitrogen reduction >50%
- Proven results for over 15 years
- Spray nozzles maximize effluent distribution over coir media surface
- Simple to use and suitable for wide range of applications
- Prepackaged, lightweight mod for easy installation
- 80%/20% split mods simplify design and installation
- No gravity recirculation valve needed
- Natural media:
 - Allows free air flow and water movement
 - Provides large, open surface area
 - Renewable and sustainable
 - Low cost and easy to ship

A Series

IM Series

NS Series

 Only mods bearing the NSF® mark are certified to NSF/ANSI Standard 40, Class I
